

# International Childhood Cancer Day drives better access to care for children and adolescents with cancer

Issued by [Icon Oncology](#)

15 Feb 2022

*Educating parents to understand warning signs can save lives.*

On [International Childhood Cancer Day](#), [Icon Oncology](#) is joining the global oncology community to raise awareness about childhood cancers and to express support for children and teenagers with cancer, and their families.

Every year more than 400,000 children and young people (below the age of 20) around the world are diagnosed with cancer. Sadly, survival rates depend on geographical location, with an 80% survival rate in most high-income countries, compared to rates as low as 20% in low- and middle-income countries.

Unfortunately, despite being defined by the World Bank as a high-middle-income country, South Africa mirrors poor survival outcomes. “We reside in a divided landscape, with access to first-world standard of care

healthcare and treatment reserved for those who can afford private medical care. Sadly, the vast majority of our population faces socio-economic and geographical barriers to accessing life-saving treatment,” explains Dr Johann Riedemann, a clinical and radiation oncologist with a special interest in childhood cancers.

Dr Riedemann is part of a national network of more than 150 private oncologists who under the Icon Oncology banner, are championing better access to quality cancer treatment for all South Africans. One of the ways in which they are achieving this is to invest in state-of-the-art technology which can be used to treat cancer.

In radiation oncology, specialist machines called linear accelerators (Linacs) are used to precision-target tumours, destroy cancer cells and limit unwanted toxicity to normal cells. Icon Oncology recently installed a new Linac at the Cape Gate Oncology Unit where Dr Riedemann and his colleagues from [Cancercare](#) work to treat cancer patients – including children who previously had to travel great distances to receive treatment in Cape Town. Relieving this geographical barrier is a blessing to both parent and child amidst the challenge of cancer.

Dr Riedemann explains that early detection and treatment for childhood cancers are important: “If detected early, *many children* can be treated successfully. Research shows that the sooner a child is diagnosed the better the outcome for the patient. Parents can equip themselves with knowing the warning signs of childhood cancers and when to consult a doctor if these symptoms persist,” says Dr Riedemann.

## **Warning signs parents should be concerned about:**

Cancer in children is not common, but it is important to have your child checked by a doctor if they have unusual signs or symptoms that persist:

- An unusual lump or swelling
- Unexplained paleness and loss of energy; associated failure to thrive
- Easy bruising or bleeding
- An ongoing pain in one area of the body; especially when present or worse at night
- Limping without a history injury/trauma
- Unexplained fever or illness that does not go away

- Frequent headaches, often with vomiting
- Any worsening visual, cognitive and/or hearing abnormalities
- Unexplained weight loss – fits in with failure to thrive

## **When to visit a doctor – Private sector**

### **Step 1: General Practitioner (GP) or family doctor**

If you are concerned about any persistent symptoms, or if your child is not responding to over-the-counter medication, make an appointment with your GP. Children are not mini-adults and if your GP finds reason for concern, they will refer you to a paediatrician.

### **Step 2: Paediatrician** (a medical practitioner specialising in children and their diseases)

Paediatricians are trained to identify cancer symptoms and will arrange for tests and scans to diagnose a potential cancer. They will also reach out to other specialists which will become your child's care team in case of a cancer diagnosis.

"In oncology multi-disciplinary teams work together to diagnose and treat our cancer patients. This means that your child will have a team of highly specialised doctors and supporting practitioners who will design a treatment plan which is tailored to the particular cancer and your child," explains Dr Riedemann.

### **What if you do not have medical aid?**

- Do not ignore persistent symptoms and make sure you visit your closest Department of Health Clinic or if you can afford it, a general practitioner in your area.
- Come prepared with a list of the symptoms which concern you; point these out to the healthcare practitioner who examines your child.
- Ask for a referral to a specialist at your closest provincial hospital and make an appointment to see them.
- Most tertiary provincial hospitals will have paediatric and oncology specialists who can diagnose and treat childhood cancers.
- Many private specialists work in multi-disciplinary teams with their government and academic colleagues at state/university hospitals. For example, Dr Riedemann has partnered with the paediatric oncology department at [Tygerberg Hospital](#) in Cape Town. "We meet regularly to discuss childhood cancer cases and to ensure we share knowledge and keep up to date with the latest developments in our field. South Africa boasts the highest level of care in public hospitals in Africa. We have centres of excellence like the [Red Cross War Memorial Children's Hospital](#) in Cape Town, which is regarded as Africa's learning centre for postgraduate specialist paediatric and surgical training. Children from all nine provinces are referred here by provincial clinics and hospitals," says Dr Riedemann. a previous member of this unit's paediatric brain tumour consortium.

There are also other resources and organisations who help parents of children with cancer. This includes arranging access to treatment, practical support such as transport and accommodation as well as emotional/psycho-spiritual support including counselling and psychosocial services.
