

## Kenya plans to set up emissions trading system

NAIROBI, Kenya - Kenya aims to set up an emissions trading system that will allow companies and other bodies to buy emissions allowances, the finance minister Ukur Yatani said on Tuesday 11 May, as the country strives to limit the release of greenhouse gases.

Emissions trading is a pollution control mechanism where a central authority issues a limited number of permits for the release of specific greenhouse gases. Companies can then buy these permits and also trade them.

Many countries are using a price on carbon to meet climate goals in the form of a tax or under an emissions trading or cap-and-trade plan where companies or countries face a carbon limit.

"The government is at an advanced stage in establishing the Kenya Emissions Trading System, allowing companies and organisations to buy Emission Allowance and thereby enable Kenya to meet her commitments in limiting greenhouse emissions," Yatani told an online conference of Kenyan and European officials.

Yatani said the system would be managed through a national carbon credits and green assets registry, also soon to be established.

### CLIMATE CHANGE

Covid-19 economic impact failed to put brakes on climate change - WMO report

22 Apr 2021

## Africa most vulnerable to climate change

Africa produces little of the greenhouse gases, such as emissions from coal-fired plants, that most scientists link to rapid climate change. But it is the continent widely seen as most vulnerable to a changing

climate as much of its population is poor, rural and often dependent on rain-fed agriculture.

Kenya loses 2.0–2.4% of its gross domestic product annually due to the effects of climate change, such as drought and floods, according to a 2018 Kenya National Bureau of Statistics study. The study also showed droughts cost Kenya 8% of GDP every five years.

Last June, the finance ministry said Kenya planned to issue its first sovereign green bond.

Yatani told the conference the bond will be launched "soon", and that Kenya also planned to speed up the formation of the Kenya Green Investment Bank to allow easier access to finance for government and private projects in areas such as renewable energy, energy efficiency, green transport and waste-water treatment.

Kenya says it aims to achieve a net-zero carbon neutral economy by 2050.
