

Hazardous environments call for zero tolerance on alcohol use

 By Rhys Evans

27 May 2016

The warehousing environment is a hazardous industry, as employees must often work with and operate overhead cranes, forklifts and other dangerous machinery, where there is always a chance of human error and accidents. The danger is increased significantly if employees are operating machinery under the influence of alcohol, as it affects behaviour and slows down reaction times.

In order to mitigate this risk, warehouses need to adopt a zero tolerance approach to alcohol consumption in the workplace, backed up by effective policies as well as compulsory daily alcohol testing of every employee every day.

According to the Occupational Health and Safety (OHS) Act, employees are not permitted to be in the workplace under the influence of alcohol, no matter what industry they work in. Intoxicated employees may experience compromised cognitive ability and impaired decision-making, as alcohol is proven to increase risk-taking behaviour while decreasing inhibitions.

In the warehousing industry, the effects of alcohol consumption in the workplace can be catastrophic. Accidents with heavy machinery can cause serious injury and even death and, if it can be proven that the operator of the machinery was operating under the influence and management did not take steps to prevent this, then the company can be held liable for damages. Ensuring the safety and wellbeing of all employees within the warehouse workplace should be a top priority.

Policies needed

The first step is to adopt a zero tolerance approach, as mandated by the OHS Act. This requires that policies be put into place, which needs to include mandatory daily breathalyser testing of every employee, as they enter the workplace.

If only random testing is implemented, or employees are not tested every day, then alcohol usage is difficult to control because of the large number of staff involved in many warehouse ventures. In addition, education needs to form a critical component of any alcohol program, for even if people are tested on arrival, they may drink during the day. Education into the dangers of alcohol consumption in the workplace, with examples of the consequences of actions taken under the influence, can act as a significant deterrent.

Breathalyser linked to key access

New breathalyser technology too can play a role in ensuring compliance with zero tolerance policies. Key management solutions are in place in many warehouses in order to control and monitor who has access to keys for any physical asset, including heavy machinery such as forklifts and cranes. Intelligent, electronic key management systems provide a full audited history of key transactions, and new solutions incorporate a breathalyser function into this solution.

Regular key management typically requires the user to input a personal PIN number as well as his fingerprint in order to retrieve keys. The system then logs the time the keys were retrieved and by whom. The PIN and fingerprint must then be re-entered in order to return the keys, again logging the time and access code. With new breathalyser enabled solutions, users must not only enter a PIN and fingerprint, but also blow into an integrated breathalyser and demonstrate their sobriety by ensuring their breath alcohol is under the prescribed limit. Only then will the keys be released.

If the user does not pass the breathalyser portion, the keys will not be released, and the name of the person will be logged along with the breath alcohol reading. He or she will also then not be permitted to continue with work. To prevent alcohol consumption during the day while on shift, the same exercise must be repeated when the keys are returned. The system will create an alert and log the breath alcohol content of the operator should he or she fail the breathalyser upon return of the keys.

By ensuring effective policies are in place and by utilising advanced technology such as breathalyser-enabled key management systems, warehouse management can minimise the risk associated with alcohol consumption in the workplace. In addition to reducing risk, warehouses can also benefit from sober employees who require less time off, and who are less likely to cause accidents and breakages to assets and stock, not to mention avoiding workplace injury and fatality.

While new breathalyser systems will always require an upfront investment, this is typically minimal and will pay itself off quickly, effectively delivering long-term cost savings as well as OHS compliance.

ABOUT RHYS EVANS

Rhys Evans is the Director of ALCO-Safe, suppliers of superior drug and alcohol testing equipment and accessories throughout Africa

- Why companies don't always test for alcohol... and why they should - 13 Nov 2017
- Hazardous environments call for zero tolerance on alcohol use - 27 May 2016
- Identifying substance, alcohol abuse in employees - 14 Jan 2016
