

AI: The driver for mind-blowing business growth

 By [Jim Holland](#)

31 Jan 2019

The furore around Artificial Intelligence (AI) is understandable. When adopted correctly, it is a true enabler for achieving a business life without limits, and it has the potential to power future success.

Jim Holland, Country Manager at Lenovo Data Center Group Southern Africa

AI promises the possibilities of the future, and with it comes the opportunity to win the race to become 'digital'. That's why there is an expected 37.3% compound annual growth rate for the 2017 – 2022 period in global spending on cognitive and artificial intelligence (AI) systems.

However, as more businesses turn their attention to the AI hype, they need to be aware of the challenges ahead. AI, despite the frenzy, is still nascent and there is no one-size-fits-all recipe for success.

AI certainly has the ability to open monumental business opportunities, and it's easy to see why so many businesses are jumping on the bandwagon. But all businesses striving for adoption need to forge their own path, away from the traditional strategies that hold others back. This 'different' line of thinking is the only way to emerge as a digital winner.

With great possibilities comes great obstacles

It is in understanding how to utilise AI that we see many businesses struggle. Many want to adopt AI as soon as possible, but are struggling to know how AI can be used to benefit their business or optimise a specific task because of the sheer IT complexity.

AI is broader than just an IT initiative, ownership of it needs to spread across a company. Therefore businesses should look to find forums for discussions and places to test ideas. For example, at Lenovo we recently opened three innovation centres for our customers to discuss, test and innovate.

Those who successfully hurdle the obstacles in adopting AI technology will see dramatic business growth as their IT initiatives flourish.

The need for expert counsel

With AI and machine learning (ML) technology becoming more mainstream, a number of industries are already seeing big benefits. Agriculture, science and healthcare are among the multitude of industries using the technology to provide better quality services and products. From improving drought management to enhancing radiology practices, AI is the driver in optimising these solutions.

Behind these initiatives is a software-defined data centre, built to harness the power of AI. However, enterprises still need to have the flexibility to adapt. And this means the ability to operate without technology hampering their business. Therefore, it's vital businesses work with partners who invest in the AI and ML space to get the most out of their initiatives. That's why we are accelerating our AI initiatives to generate new and actionable insights in the business and science sectors.

AI driving the possibilities of the future

To reap AI rewards, businesses need to have strong foundations in place and an understanding of the technology. This starts with a flexible, future-defined and AI-optimised data centre, which is the only pillar capable of handling the vast amount of data vital for all AI models.

The right infrastructure, combined with a different line of thinking, will enable today's businesses to stand out from the rest of the competition.

ABOUT JIM HOLLAND

- Jim Holland is Country Manager at Lenovo Data Center Group Southern Africa
- Bringing AI to the data centre - 17 Apr 2019
 - Cultivating a connected world with emerging technology - 21 Feb 2019
 - AI: The driver for mind-blowing business growth - 31 Jan 2019
 - Trends empowering intelligent transformation - 3 Dec 2018
 - Encouraging a new breed of storage for the digital age - 23 Nov 2018
